Arizona Sustainability Navigator

Executive Summary | Collaboration for Good | September 2026

The Scope

10,229 independently verified resources across 87 categories, spanning Arizona's 15 counties, 10 tracked tribal nations, and statewide/national programs. No county, city, or tribal nation is marked “covered” without a genuine, confirmed resource; where none exists, that absence is documented as a gap rather than papered over.

What Counts as a Gap

This report defines a gap strictly: a resource does not exist for a specific county, tribal nation, or category. It does not count a resource that is merely hard to reach, thinly documented, or missing a phone number or email; those resources exist and count as coverage. Out of 10,229 verified resources, 197 confirmed structural gaps remain (69 across counties, 128 across tribal nations), concentrated in a small number of rural counties and tribal nations rather than spread evenly.

Where Gaps Concentrate

- Maricopa, Pima, and Coconino counties: zero documented gaps anywhere in this study.
- Greenlee (13), La Paz (11), and Apache (8) counties carry the heaviest county-level gap burden, driven mostly by thin business-facing infrastructure in small, rural jurisdictions.
- Havasupai Tribe: 37 gaps, one structural finding (no functional tribal website to research from), not 37 independent failures. Closing it requires direct outreach, not more web research.
- Ak-Chin Indian Community: 26 gaps, a different pattern: an active tribal government whose sustainability services are rarely published as named, business-facing programs.

The Event Calendar

The Hyper-Local Events category spans 915 individually dated, verified sustainability events across every county and 9 of the 10 tracked tribal nations (Ak-Chin remains the sole recorded gap), live on the site's public Events page at www.arizonasustainabilitynavigator.com through December 31, 2027. This content is maintained through manual research and import rather than an automated pipeline, so an automated sourcing mechanism remains a recommended investment, addressed below.

Remaining Platform Gaps

- Only 19 of 87 researched categories are wired into the live site's category taxonomy.
- The guided quiz can recommend from only 10 of those 19 curated categories.
- No usage analytics exist on the quiz itself or on category-level engagement.
- A known silent-failure mode exists in the county/ZIP lookup component.

Top Recommendations

- Direct outreach to Havasupai Tribe, bypassing web research entirely.
- Direct outreach to Ak-Chin Indian Community, plus deeper research on the next-highest-gap tribes.
- Targeted rural-county research: Greenlee, La Paz, Apache, Gila, and Mohave.
- Establish a recurring re-verification cadence to catch program churn before it misleads a user.
- Resolve remaining schema and documentation inconsistencies across lens categories.
- Build the automated event calendar sourcing pipeline and map the remaining 68 categories onto the platform's live taxonomy.
